Patent

Attorney Docket No.: 042390.P6942

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re Application of:

Nardin et al.

Examiner:

Craig, Dwin M.

Application No.: 09/475,717

Art Unit:

2123

Filed: December 30, 1999

For: METHOD AND APPARATUS FOR FULLY

AUTOMATED SIGNAL INTEGRITY ANALYSIS FOR DOMINO CIRCUITRY

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

DECLARATION PURSUANT TO 37 C.F.R. §1.131

Sir:

1227

... r :

We, Mark D. Nardin, Hans Greub, and Sapurnal Wijeratne, do hereby declare that:

- 1. We are the co-inventors of the above-captioned patent application and of the subject matter described and claimed therein.
- 2. Intel Corporation of Santa Clara, California, is the assignee of the patent application described above.
 - 3. We are currently employed by Intel Corporation.
- 4. Prior to November 1, 1999, we jointly reduced to practice the invention as claimed in the above-captioned patent application (hereinafter "the present invention") in this country, as evidenced by Exhibits A, B, C, D, and E. All of these documents, in their unredacted form, were generated prior to November 1, 1999.
- 5. Exhibit A is a redacted Modification Log of software code, which practiced the present invention. The Modification Log shows that the present invention was reduced to practice prior to November 1, 1999. The last entry in the Modification Log was entered prior to November 1, 1999.

1

Attorney Docket No.: 042390.P6942

Serial No.: 09/475,717

Examiner: Craig, Dwin M.
Art Unit: 2123

4-16-04; 12:59PM; INTEL

;971 214 8475

- 6. Exhibit B is a redacted portion of Parameter Extraction Code for extracting parameters of a set of domino logic circuits according to an embodiment of the present invention. The Parameter Extraction Code was reduced to practice prior to November 1, 1999.
- 7. Exhibit C is a redacted portion of an Output Log of software code that practiced the present invention. The Output Log was generated by the software code simulating a set of domino logic circuits prior to November 1, 1999.
- 8. Exhibit D is an unreducted Simulation Sequence File for simulating a set of domino logic circuits according to an ordered list. The Simulation Sequence File was generated by software code that practices the present invention prior to November 1, 1999.
- 9. Exhibit E is a redacted Simulation Time Stamp Log for a simulation executed on a set of domino logic circuits according to the Simulation Sequence File of Exhibit D. The Simulation Time Stamp Log was generated prior to November 1, 1999 by software code that practiced the present invention.
- 10. Evidence supporting that "extracting parameters of a set of domino logic circuits" was reduced to practice includes:
 - a. Exhibit B: This Exhibit illustrates a portion of Parameter Extraction Code for extracting parameters from domino logic circuits.
 - b. Exhibit C: This Exhibit of an Output Log implicitly provides evidence of extracting parameters of a set of domino logic circuits since the simulation which generated the Output Log could not have occurred without first extracting parameters of the set of domino logic circuits.
 - 11. Evidence supporting that "simulating each domino logic circuit of a set of domino logic circuits" was reduced to practice includes:
 - a. Exhibit C, page 1, lines 31-35, 37-41, 45-50, etc.: These portions of Exhibit C illustrate the simulation results of domino logic circuits and therefore evidence that domino logic circuits were simulated.
 - 12. Evidence supporting that "reporting results of the simulation indicating whether any of the domino logic circuit is likely to generate an erroneous output" was reduced to practice includes:

2

a. Exhibit C, page 2, lines 3 (for example): The portion "+0.048V DYNOUT" indicates that the particular domino circuit simulated has a positive noise margin

Attorney Docket No.: 042390.P6942

Serial No.: 09/475,717

Examiner: Craig, Dwin M. Art Unit: 2123 4-16-04; 12:59PM; INTEL

;971 214 6475

and therefore has a low likelihood to generate an erroneous output. A negative noise margin would be an indication that the particular domino circuit is likely to generate an erroneous output. The greater a negative noise margin the more likely an erroneous output. The more positive a noise margin the less likely an erroneous output.

- b. Exhibit C, page 2, line 43: This portion of Exhibit C indicates that zero domino circuits of the simulated test circuit were likely to generate an erroneous output.
- 13. Evidence supporting that "scheduling a set of domino logic circuits into an ordered list, the ordered list positioning all domino logic circuits of the set of domino logic circuits feeding into an input of another domino logic circuit of the set of domino logic circuits before a position of the another domino logic circuit in the ordered list" was reduced to practice includes:
 - a. Exhibit D, page 1, lines 5, 13, 33, 43, and 50: The "simulation counts" schedule domino logic circuits into an ordered list or stages. This ordered list positions all domino logic circuits feeding into an input of another domino logic circuit before a position of the another domino logic circuit.
- 14. Evidence supporting that "simulating each domino logic circuit according to the ordered list" was reduced to practice includes:
 - a. Exhibit E: This Exhibit illustrates start and end time stamps of each stage of domino logic circuits scheduled for simulation in the Simulation Sequence File of Exhibit D. As can be seen the latest simulation end time of stage 1 "14:59:50" (Exhibit E, page 1, line 16) is before the earliest simulation start time of stage 3 "15:00:56" (Exhibit E, page 1, line 30). The latest simulation end time of stage 3 "15:47:53" (Exhibit E, page 1, line 40) is before the earliest simulation start time of stage 4 "15:49:02" (Exhibit E, page 1, line 50), and so on. Note, state 2 is not included in Exhibit E because stage 2 of the circuit under test did not include any logic circuits to simulate.
- 15. Evidence supporting that "determining whether any of the domino logic circuits is likely to generate an erroneous output" was reduced to practice includes:

3

a. Exhibit C, page 2, line 43: The indication that "0 domino circuits has negative noise margins" is a determination whether any of the domino logic circuits of the

Attorney Docket No.: 042390.P6942

Serial No.: 09/475,717

Examiner: Craig, Dwin M.

Art Unit: 2123

4-16-04; 12:59PM; INTEL

;971 214 6475

circuit under test were likely to generate an erroneous output. Any domino logic circuit having a negative noise margin would have been likely to generate an erroneous output.

We hereby declare that all statements made herein of our own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the above-identified application or any patent issued thereon.

Respectfully submitted,

17
             #* Functional description:
18
 19
              #* This script extracts domino circuits and simulates the dominos and
 20
              #* inverting gates igates in stages using dominosim for simulating the
 21
              #* the dominos for chargesharing, residual (propagated noise from the
 22
              #* input to the output), and the injected crosstalk voltage at the output,
 23
              #* and using go_nm to characterize UGNMH vs Vout for custom or zgcells
 24
              #* connected to dominos and and then propagates the worst case
 25
              #* voltage drop on the domino output through the inverting gates to get
 26
               #* the input residual for the next domino stage.
 27
               #* All propagated residuals are captured in the file:
 28
               #* xcap/domino/data/<fub>.residual
 29
               #* A margin report for all domino outputs is written to the file:

   39
   40
                # Data Structures
   41
                # The Domino Output Noise Info is stored in the hash:
   42
                # $DomOutput {$pathmill_node_name} = \@domino_output_record;
   43
                # each entry contains pointer to a domino_output_record with the following format:
   44
   45
                @domino\_output\_record = (Reff, Rline, Ctot, Cx, Residual, Peak, Fub\_Pin, Supply\_Noise, ChargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeShargeS
   46
                 aring, SAverage_Attacker_Slope, $assumed_fixed_value);
   47
                 # The Domino Input Noise Info is stored in the hash:
    48
                 # $DomInput{$pathmill_node_name}=\@domino_input_record;
    49
                 # Each entry points to a record which contains:
    50
    51
                 @domino_input_record=($Reff,$Rline,$Ctot,$Cx,$Residual,$Source_of_Residual,$Peak,$Fub_Pin,$Suppl
    52
                 y_Noise,$Average_Attacker_Slope);
    53
                  # changed keys from ipath to pathmill notation
```

```
# - added the mapping hashes for simulation
     # %map_out2igate{$node} ="igate${id}$fub"
2
        %map_out2domino{$node}="dom${id}$fub"
3
      # these hashes map an output node to a domino or igate cell name
4
      # added the following hashes
      @receiver_record=($domino_driven_input_pin,$source_config,$invelm_output,$invelm_name,$invelm_ty
7
8
      # The hash %map_igate_out2igate_record maps igate outputs to igate records
      # @igate_record=($invelm_type,$source_config,\@domino_driven_input_list,
10
                 @domino_driven_input_pin_list,$invelm_name);
11
12
      # obsolete $map_igate_receiver{$domino_driven_input}=\@receiver_records;
13
      # $map_igate_out2cell_type{$igate_output}=$cell_type;
14
      # The residual on igate outputs must be propagated thru
15
      # passgates. The hash %short_igate2dynin with key Sigate_output_node
16
       # points to an array (list) of dynin nodes to which the residual
17
       # needs to be propagated.
18
       # $short_igate2dynin{$igate_node}=\@dynin_node_list;
19
       # push(@{$short_igate2dynin{$igate_node}},$dynin_node);
20
21
22
       # Modification Log
                - added fub_boundary condition check for fub outputs
23
              - added fub_boundary statements for fub input
24
              - changed no receivers found on domino outputs to
25
               warning messages to handle nocons better
26
                 - moving databases instead of deleting them!
27
       #
                - fixed bug in domino_stageN.pN cell list generation
28
                - changed noise propagation from DYNOUT based to igate cell
29
               based to conform to order in sim_sequence
30
       #
                 - added -use_previous_results feature
       #
                - added archiving and output of $fub.residuals
                - added database migration for -start_fresh option
 33
        #
                - added $ENV{CSEJOBNOMAIL}="TRUE";
 34
                 - removed path to /usr/homel/hgreub version of
 35
                igate_identify
 36
                 - removed path checking for domino_extract because
 37
        #
 38
                it hangs in CTM
               - changed tesh path since /bin/tesh does not work in
 39
        #
 40
                CTM
                  - fixed bug in migrate_dp which cause domino_manager
 41
                to quit if -start_fresh option is used and no db
 42
                datafiles exist
 43
                 - fixed 'nbq -Pcs' instead $command_prefix bug in
 44
 45
                domino simulate section
                - added -f flag to tesh to fix some problems with
 46
 47
                setup in CTM
                 - added support for custom cells that the user wants
 48
 49
                to treat like standard cells
        #
                if a cell custom_cell that is listed in the inv_element_fub.dat
  50
                file and thus was declared to be treated like a standard cell
  51
                in the xcap/domino/igate_no_extract_fub.dat file, domino_manager
  52
                looks for a command file "custom_cell.cmd" and if it exists
  53
                 will simulate this cell once and read in the results
```

```
removed -x from tesh -f -x
                changed pathmill2plus to not add fubname prefix for fub pins
2
                - changed read_transgate_domino_sim, looks like header in the
3456789
              file changed
               - fixed bug in UGNMH computation, lowest UGNMH instead of highest
      #
              UGNMH with lowest NT was kept
               - fixed bug in residual propagation through passgates, the new
              residual value was copied in without checking whether the existing
              value is (worst case)
             - fixed argument processing so that domino_manager -<anything> gives
10
11
              usage message
                - added handling of case if 2*($vout-2*$vout2) is zero
12
               in compute_propagated_residual()
13
                 - added check for TIM version 2.8.b1
14
                 - added message to re-run xcap_mutex and xcap_change_psn
15
                - added handling of domino/igate not reported condition in
16
               sim seq file
17
       #
               _- fixed migrate_db() for igate
18
                 - fixed worst noise level reported in domino_finalreport
19
       #

    added an enhancement to deal with multiple tri-state drivers

20
       #
               connected to an igate output node (works for stdcells only)
21
       #
                 - fixed domino residual propagation bug, fub.residuals was correct
22
       #
               but %DomInput data was still bad
23
                 - increased min chunk from 12 to 24 because of netbatch overflow.
24
       #
                 - changed initial values in DomOutput to make sure dominos that
25
               have not been simulated will fail
26

    added sanity checks to read_sim_seq files

27
                  - fixed residual propagation through passgates
28
                   - added archiving of siminofo file used for domino simulation
29
30
 31
 32
        SVERSION="2.0";
        $last_modified="
 33
 34
 35

       * SUMMARY of DOMINO REPORT *
 35
 36
        249 dominos were found in FUB: faaddc
 38
 39
        0 dominos were not mapped or extracted
 40
        2 dominos had no receivers (NOCONS?)
 41
        0 dominos were assumed to be fixed for noise propagation
 42
        0 domino circuits had negative noise margins
```
